

RMOne AI Agents

Embed Integration Architecture Guide

External Website Integration Documentation
Version 2.0 | January 2026

Key Benefits:

1. Executive Summary

- One-click embed generation with unique secure tokens
- Domain-restricted access with automatic subdomain support
- Role-based permissions (Superadmin, Admin, User)
- Token-based authentication (works in all browsers, including Safari)
- No cookies required - iframe compatible

Component Overview:

- Integration Management Page: Admin interface to create/ manage embed links
- Embed Token System: Secure 16-character unique identifiers per embed
- Domain Validator: Restricts embed usage to authorized domains
- Role-Based Access Control: Three permission levels with granular access
- Session Management: Isolated chat history per embed instance

3. How It Works

- 1
- Create Embed Link
- Admin navigates to Integration page and creates a new embed link with name, role, and allowed domain.
- 2

Configure Domain

Specify the allowed domain (e.g., rmone.com). All subdomains are automatically included.

3

Select Role

Choose permission level: Superadmin (full access), Admin (logs + FAQ), or User (chat only).

4

Copy & Embed

Copy the generated iframe code and paste into your website. That's it!

4. Role-Based Permissions

Feature	Superadmin	Admin	User
Chat with AI	✔	✔	✔
View Chat History	✔	✔	✔
Query Logs Access	✔ All logs	✔ Own logs	✖
FAQ Management	✔	✔	✖
Edit Chat Titles	✔	✔	✖
Integration Management	✔	✖	✖

Token-Based Authentication

Unlike traditional cookie-based auth, embed uses secure tokens sent via HTTP headers. This bypasses third-party cookie restrictions in modern browsers (Safari, Chrome) making it iframe-compatible.

5. Security Features

- Domain Validation: Embeds only work on authorized domains
- Unique Tokens: Each embed has a cryptographically secure 16-character ID
- Subdomain Support: Each embed instance has separate chat history
- No Cookie Dependency: Works reliably in all iframe scenarios
- Audit Trail: Last-used timestamps tracked for each embed

6. Domain Configuration

- When you set the allowed domain to `rmone.com`, the following are automatically allowed:
- `rmone.com` (exact match)
 - `portal.rmone.com` (subdomain)
 - `app.rmone.com` (subdomain)
 - `staging.portal.rmone.com` (nested subdomain)

7. Quick Start Checklist

1. Login to RMOne AI Agents as Superadmin
2. Navigate to Integration page
3. Click "Create New Embed Link"
4. Enter a descriptive name (e.g., "RMOne Portal - Admin")
5. Set the allowed domain (e.g., `rmone.com`)
6. Select the appropriate role
7. Click Create

8. Copy the iframe code
9. Paste into your website HTML
10. Done! The chatbot is now embedded.

8. Technical Specifications

Authentication Method	Token-based (X-Embed-Token header)
Token Length	16 characters (alphanumeric)
Session Storage	Browser sessionStorage (isolated per embed)
Cookie Requirement	None (iframe compatible)
Browser Support	All modern browsers including Safari
Production URL	https://rmchat.vyaasai.com
